STATE OF THE ART – FIRST IN THE WORLD

➔ What is **stealthtext** and **stealthrelay**?

stealthtext is a way to send **stealthcoin** privately and securely using SMS texting.

➔ How is **stealthtext** different than other services?

stealthtext is invaluable in situations where you can not access a data plan. With **stealthtext**, you can send others **stealthcoin** directly from your wallet and receive confirmation by SMS. Unlike other services, it uses banking-grade encryption to protect your transactions from the prying eyes of onlookers. Additionally, your transactions are tamper resistant, so you can be completely confident that the transaction you enter into your phone is faithfully executed by the **stealthcoin** network.

➔ What is **stealthrelay** ?

stealthrelay is a simple message relay that extracts an encrypted stealthtext transaction from a local, designated mailbox. It then dispatches the encrypted transaction to the **stealthcoin** wallet where it is decrypted and broadcast to the **stealthcoin** Tor network.

Additional information and downloads for **stealthtext** and **stealthrelay** can be found here (click buttons):
